**Laser-plasma accelerators**

Laboratoire d’Optique Appliquée, ENSTA ParisTech - CNRS UMR7639- École Polytechnique, Chemin de la Hunière, 91761 Palaiseau, France

Laser plasma accelerators provide electron beams with remarkable parameters. Based on the use of giant longitudinal electric fields that result from the interaction of an intense laser pulse with a plasma medium, laser plasma accelerators offer today the possibility to generate, in a compact and reproducible way, energetic electron beams with tuneable parameters. Different schemes of injection, such as the forced laser wake field [1], the bubble/blow out regime [2], or the colliding laser pulses [3], have been recently demonstrated at LOA. These electron beams with peak current of a few kA [4] are of interest for a very broad range of applications in medical, biological, chemistry or material science domains [5]. They are also of major interest for the production of very bright X/gamma ray beams [6]. I report here on the evolution of laser plasma accelerators developed at LOA and on very recent achievements we performed on the applications side.
